

Collaborating to Heal Addiction and Mental health in Primary care (CHAMP) ***Strategies to Increase Patients Eligible for CHAMP***

Patients Diagnosed with OUD or Provider Concerned about OUD use

- Provider has clinical concern about patient with OUD and/or MHD symptoms
- Patients must be screened with the NMA but do not need to screen positive
- Patients still need to meet the criteria for OUD - could include patients in remission
 - o Note many of these criteria can be observed and do not rely on patient reporting but rather clinical judgement - (2 of the 11 criteria met in the last 12 months)
- Patients still need to meet MHD screening parameters
- Potential patients to consider:
 - o Patient on mOUD that are not completely stable but no longer screen positive on NMA
 - o Patients on mOUD that still have significant anxiety, depression, or PTSD symptoms
 - o Patients taking prescribed opioids that meet criteria for OUD and have MHD symptoms

Patients with Lower Eligibility Scores on the Mental Health Screeners

- We have lowered the eligibility criteria for MHD symptoms:
 - o PHQ9: 5 or greater
 - o GAD7: 5 or greater
 - o PTSD-PC: 1 or greater
- Potential patients to consider:
 - o Patients with OUD and even mild symptoms of depression, anxiety or PTSD

Patients Identified through Targeted Screening

- Consider specifically screening targeted higher risk populations:
 - o Patients with opioid prescription
 - o Patients with evidence of injection drug use
 - o Patients with prior OUD, depression, anxiety or PTSD diagnosis
 - o Patients recent hospitalized with issues [related to chronic pain or OUD](#)
 - o Patient with emergency department visit that is OUD related
 - o Patients engaged in substance use disorder support groups
 - o Patients with a tobacco use disorder
 - o Patient with an alcohol use disorder
 - o Patients with hepatitis C

Talk to your CHAMP Team and Attend Support calls to Discuss Patient Engagement in mOUD
