

MOUD and Street Opioids

PAUL BARRY, MSW, LICSW
CLINICIAN TRAINER AND PRACTICE COACH

UW Medicine

1

- AGENDA
- Anything on your mind?
- Data capture in CMTS
- MOUD and street opioids

UW Medicine

2

CMTS DATA Support

- Six-month MOUD summaries- data audit
- Please faithfully enter no-shows for you and your prescribers going forward
- Please monitor that you've entering the MOUD medication accurately on the prescriber encounter

UW Medicine

3

Six-month MOUD Summary for ALL Patients

UW Medicine

4

Medications for Opioid Use Disorder (MOUD)

UW Medicine

5

Opioids and the Brain

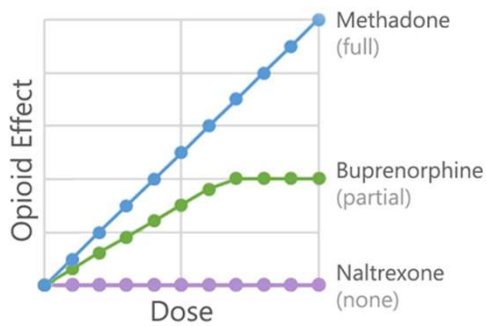

UW Medicine

6

OUD Treatment Medications: Agonists and Antagonists

UW Medicine

7

Medications: Good for the Patient

- Effective treatment for a challenging chronic disease
- Reduce deaths
- Meds are safe and effective
- Well-tolerated
- Support recovery
- Stabilize function and control cravings
- Prevent recurrence of disease

National Academy of Sciences
Consensus Report March 2019

UW Medicine

8

Buprenorphine

- Partial agonist with slow onset
- Available as tablet or film, generally offered in a duo product with Naloxone (Narcan) for safety
- Effect on the brain
 - *Ceiling effect* on respiratory depression
 - *High affinity* for μ -opioid receptor
 - *Slowly dissociates* from μ -opioid receptors

UW Medicine

9

Buprenorphine Side Effects

- Side effects may be less intense than full agonists
- Minimal potential for respiratory depression - *Safer than Tylenol*
- Patients may experience oral issues at site of ingestion (dissolves in the mouth)
- Other typical opioid side effects:
 - Constipation, Vomiting
 - Insomnia/sleepiness
 - Disturbance in attention
- Patients' principal concern may be withdrawal effects in transition from street drugs to buprenorphine
 - Importance of comfort meds

UW Medicine

10

Main Buprenorphine Products

- **Suboxone** (Zubsolv, Bunavail) "bupe, subs"
 - Buprenorphine **with naloxone (Narcan)**
 - Most common medication formulation
- **Sublocade** (Extended-Release Buprenorphine)
 - Monthly injection
 - Indicated for patients who have been stable on buprenorphine for at least 7 days
- **Subutex**
 - Buprenorphine mono product- higher risk for abuse/diversion

Current Issues in Street Opioids

UW Medicine

12

Overdose Deaths Soared during the Pandemic

Figure 2. National Drug-Involved Overdose Deaths*, Number Among All Ages, 1999-2021

<https://nida.nih.gov/research-topics/trends-statistics/overdose-death-rates>

UW Medicine

13

Fentanyl- a extremely powerful drug

- Fentanyl was involved in 64% of >100,000 estimated U.S. drug overdose deaths during May 2020–April 2021
- Injection drug use was reported in 25% of deaths, and non-injection routes of drug use in **27%** of deaths
- 40% of Fentanyl-involved deaths also involved stimulants

O'Donnell et al, December 2021

<https://www.lacedandlethal.com/>

UW Medicine

14

Fentanyl- Mexis, Oxy 80s, Percs

- Most street drugs these days will contain fentanyl
- Fentanyl can come in multiple forms and multiple colors
- Samples may look similar but have different ranges of purity and mixes of other substances
- You cannot tell what is in a drug or how strong it is by its appearance

UW Medicine

15

The Dangers of the Unregulated Drug Market: King County Snapshot 2/15/23

- Powder samples: 15.5 to 30.3% fentanyl
- Pill Samples: Approx 100mg with fentanyl ranging from 1.7%-3.2% (Acetaminophen 27.7%-45.4%)

UW Medicine

16

Reasons for Increase in Deaths

- Huge Impact of fentanyl
 - Availability
 - Price
 - Concentration
 - Variability in product
- Perceived lower risk of smoking pills over IVDU
- Covid pandemic isolation
 - Using alone
 - Reduction of regular recovery supports

UW Medicine

17

Xylazine

- Xylazine is a veterinary anesthetic, not approved for use in humans, often cut into powder heroin/fentanyl, sometimes called *tranq*, *tranq dope* or *sleep cut*
- It's not an opioid. It has strong sedative effects and excessive sleepiness without euphoria.
- It starts quickly and makes people fall out hard for about the first hour if they're not used to it.
- Xylazine can extend the duration effect of fentanyl, so people don't get sick again in two hours

National Harm Reduction Coalition Harmreduction.org

UW Medicine

18

Xylazine Impacts

- Xylazine injection creates vasoconstriction causing hideous necrotic wounds which can become extensive, chronic and difficult to heal on their own
- These can occur beyond the site of injection, e.g. anywhere with a bite or cut Risk of hypo and hyperthermia and injuries from falls due to intense sedation
- Naloxone is not effective on Xylazine but will still help with opioid part of overdose

UW Medicine

19

Fentanyl Overdose

During 2019-2020, overdose deaths involving illicitly manufactured fentanyl (IMF) increased sharply in several parts of the country

AMONG IMF-INVOLVED 2020 DEATHS

Many routes of drug use were reported including injection, snorting, smoking, and ingesting

Timely response is key to preventing overdose deaths

UW Medicine

20

What is Naloxone

- Opioid overdose antidote, an antagonist- blocks the opioid receptor to restore breathing
- Has no effect on someone who has not taken opioids and is safe to use on children and pregnant women.
- Effect lasts 30-90 minutes only
- Does not make someone more likely to use more drugs
- It is rare someone reacts aggressively after receiving naloxone

UW Medicine

UW Medicine

22

Tips for Talking about Naloxone

- Discuss other risk reduction strategies
- Help the client make an OD prevention plan
- Make sure others know where they keep naloxone
- Take the opportunity to talk about protecting friends and family members if appropriate
